Child Well-Being from the Shipibo Community Worldview in San Francisco, Ucayali

Telma Ponce Cóndor

1 Introduction

EChild well-being (bakabo) brings together the body, the spirit, nature, and community life as part of the Shipibo worldview.

Among Indigenous Amazonian peoples, child well-being has distinct meanings connected to spirituality, culture, and community practices.

3 Objective and Hypothesis

To describe and analyze community conceptions of child well-being (bakabo) in the Shipibo Indigenous community of San Francisco and their incorporation into intercultural bilingual learning experiences.

Four dimensions are considered: nutrition, recreation, communication, and hygiene.

Research question

How is child well-being understood in San Francisco, and how can it be incorporated into intercultural bilingual learning?

5 Participants and Strategies

18 mothers / with children aged 0–6
3 teachers / in early childhood education
5 Indigenous knowledge holders from UNIA
TOTAL: 26 participants

7 Pedagogical Strategies

The Shipibo worldview strengthens cultural identity, family bonds, and child well-being through nature, play, and traditions, promoting solidarity, respect, and harmonious community life.

9 Recommendations

It is recommended that ancestral Shipibo knowledge be incorporated into intercultural education, families be involved in teaching, and traditional foods be promoted. Efforts should also strengthen the transmission of ancestral knowledge and support further research on Shipibo child well-being, considering its spiritual and nutritional dimensions.

10 Abstract

The study describes child well-being from the perspective of the Shipibo community worldview in San Francisco, Ucayali, considering communal child-rearing, spiritual care, and food sovereignty. It adopts a qualitative, ethnographic, and descriptive approach, involving 26 participants. It seeks to strengthen children's cultural identity by incorporating ancestral knowledge into intercultural learning experiences.

2 Problem Statement

EThere are gaps between basic and educational services and the community's needs. Access to the community is difficult, and internet connectivity is limited or nonexistent. Differences persist between official educational guidelines and community practices. Poverty and difficulties accessing basic services pose challenges to child well-being.

4 Methodology

LThe study adopts a qualitative, ethnographic, intercultural, and participatory approach. It uses interviews, observation, and dialogue with mothers, teachers, and Indigenous knowledge holders from UNIA, focusing on nutrition, recreation, communication, and hygiene. Fieldwork is conducted in San Francisco with prior authorization from the community.

6 Discussion and Results

The findings show that Shipibo child well-being is strengthened through communal child-rearing, spiritual practices, and traditional foods. However, processed foods are becoming increasingly influential. It is therefore important to preserve ancestral knowledge and incorporate it into intercultural learning experiences.

8 Conclusions

The study concludes that the Shipibo community worldview contributes to child well-being through communal child-rearing, spiritual care, and traditional foods. It also highlights the importance of passing on ancestral knowledge and incorporating it into intercultural learning experiences to strengthen children's cultural identity and well-being.
